

Different Parts Of The Human Body

The different parts of the human body include:

HEAD: The head consists of a pair of ears, a pair of eyes, a nose, and a mouth, which contains the tongue inside it.

EARS: The ears help us to hear the different types of sounds and noise.

EYES: The eyes help us to see the things around us.

NOSE: The nose helps us to smell things.

MOUTH: The mouth contains saliva. When you take in food, the saliva present inside mixes with the food and breaks down the food. This helps us to digest and absorb the nutrients from the food.

TONGUE: The tongue helps us to taste food and differentiate between the different tastes (sweet, sour, hot, cold, etc.). It also helps move the food inside the mouth while chewing.

NECK: The neck supports the head and also helps it to turn left, right, up, and down.

HANDS AND FINGERS: The hands, along with the fingers, help us to hold things or touch something.

ELBOW: The elbow is a joint that helps the arm to move forward and backward (like a hinge). It also helps us to rotate the arm inward and outward.

KNEE: The knee is a joint that connects the thigh to the leg.

ANKLE AND FOOT: The ankle (joint) and the foot help a person to walk, stand, run, and jog.
