

The Five Different Sense Organs

Read the text below to learn about the different sense organs and how they help organisms.

The **EYES**, referred to as the "Sense of Sight," help us see things around us.

The **EARS**, referred to as the "Sense of Hearing," help us hear different sounds. Some sounds are loud (for example, the sound of firecrackers) and some are soft and melodious (the chirping of birds).

Next comes the **NOSE** or the "Sense of Smell." The nose helps us distinguish between the different types of smell. Some smells are pleasant (perfume) and some are unpleasant (garbage).

The **TONGUE** helps us taste things. The tongue or the "Sense of Taste" helps us know if a particular food is tasty (pizza), hot (hot water), cold (ice-cream), sour (lemon), spicy (chilies or pepper), or sweet (pastries).

Among the five sense organs, the **SKIN** is the largest. It provides "Sense of Touch." The skin helps us feel the different types of sensations.

Write the name of each human sense organ correctly.

Image	What They Do	Sense Organ
	Help us see things or "Sense of Sight."	_____
	Help us hear or "Sense of Hearing."	_____
	Helps us hear or "Sense of Hearing."	_____
	Helps us taste or "Sense of Taste."	_____
	Helps us feel things or "Sense of Touch."	_____

Label the five different sense organs.
