

Causes Of Vomiting In Toddlers

Vomiting in toddlers can be caused by **stomach infections**, with viral gastroenteritis being the most common type.

An **infected appendix** can cause symptoms such as nausea, vomiting, abdominal pain, loss of appetite, and a low fever in toddlers.

Toddlers may vomit if they have ingested **toxic substances**, such as wild plants, soaps, and detergents.

Vomiting can also be caused by **irritation of the esophageal lining** from stomach acid.

Overeating or swallowing excess air during feeding can lead to vomiting in toddlers.

Some **medications** can cause vomiting in toddlers, particularly if taken on an empty stomach.

Ear infections can cause vomiting as well as dizziness in toddlers.

Vomiting can also be a symptom of several **infections**, including septicemia and meningitis.
