

Tips To Inflate, Deflate, And Store Baby Floats

Floats can be inflated manually or with an electric pump.

Pinch the base of the valve on the float and attach the pump.

Release and close the valve once the float has reached the desired level of inflation.

Thoroughly deflate the float before storing it to prevent damage.

Pinch the valve and gently press the float's body to remove stuck air.

Fold any add-ons towards the inside part of the float.

Try to fold the float in the direction of the seams to prevent tears.
