

Social And Emotional Growth Of Children Through Dolls

3

Playing with dolls helps children interpret people's behaviors and respond, thus improving their social cognitive skills.

It helps improve social interaction skills as they engage in pretend play.

Doll play stimulates the brain region responsible for social processing and empathy in children, making them empathetic individuals.

Dolls provide a way for children to express themselves better when they struggle to use words.

Playing with dolls helps children understand babies and not be frightened of them.
