

Honing Vs. Sharpening Knives

Honing

It is a method used when the knife's blade needs realignment.

It manipulates the existing blade without drastically scraping it.

It requires tools like a honing rod.

A knife requires honing frequently or after each use.

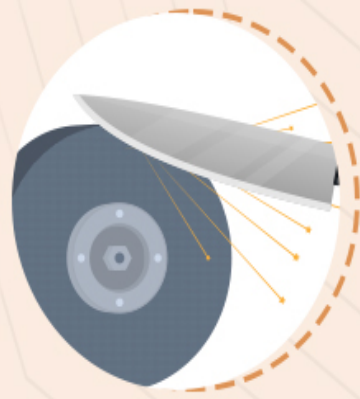

Sharpening

It is a method used when the knife's blade has become blunt.

It creates a new edge by filing the blunt blade.

It requires tools like a whetstone or electric sharpener.

A knife requires sharpening at least twice or thrice a year.
